

# ProCoat™ by link Industries

## Architectural Coated Duct Systems

### FOR COMMERCIAL & INDUSTRIAL APPLICATIONS

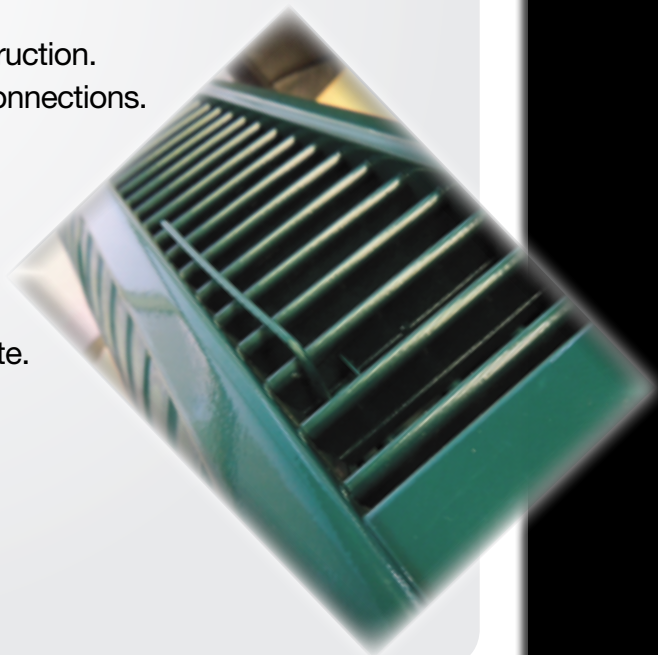

ProCoat™ is a “baked on” powder coated system applied to the outer shell of the HVAC air duct system. The primer coat is a zinc-rich epoxy. It provides superior chemical resistance -- equal to, or better than PVC. The polyester top coat protects the base coat and adds a clean glossy finish.

ProCoat gives clients the freedom to choose the precise hue required for the project. Standard stock colors are black, red, blue, white, green and orange. Custom colors can be successfully matched using the RAL color matching system.

Orders are shipped with care. The powder coating creates a hard shell barrier that is not easily scratched. However, in case of damage, touch-up paint is provided at the time of delivery.

ProCoat is available in both single and double wall construction. Clients can choose to use self-sealing or nongasketed connections.

For underground and more corrosive environments, try ProCoat Plus™. It uses the same science behind ProCoat, but is applied to both the inside and outside of the ductwork for increased protection. Unless otherwise specified, ProCoat Plus will be provided in white.
